this book focuses on the low frequency oscillation between emus and traction networks in high speed railways as the power source of high speed trains the traction network s power performance directly affects the safe and stable operation of the train however the low frequency oscillation between emus and traction networks will fluctuate voltage or current resulting in poor power quality electrical device failure and even interruption of traction power therefore it is important to reveal the mechanism of low frequency oscillation and propose suppression strategies this book systematically shows the newest research results of analysis and suppression of low frequency oscillation between emus and traction networks in high speed railways especially in the modeling methods of vehicle grid systems and suppression strategies for low frequency oscillation these methods or strategies can provide important references and help for researchers scholars and engineers on traction power technology in high speed railways the main contents include the

overview of low frequency oscillation between emus and traction networks the introduction of main modeling methods for vehicle grid systems especially single phase rectifiers the line side converter control algorithms in vehicles for the suppression of low frequency oscillation the traction substation power compensation strategies for the suppression of low frequency oscillation etc
